Niramay Kelkar

San Jose, CA | (857) 263-1743 | niramayrkelkar@gmail.com | linkedin.com/in/niramay-kelkar | github.com/Niramay-Kelkar

SUMMARY

Software engineer with 6 years shipping production systems end to end, from unscoped problems worked out directly with business users to an open-source AI matching platform built and deployed solo. Owns ambiguity across backend, frontend and data, and is comfortable in the room with the customer.

TECHNICAL SKILLS

AI and LLM Systems: Claude Code, LLM-assisted development, multi-provider LLM routing with failover, Sentence-BERT, pgvector, embeddings, semantic search, RAG-style grounded generation, eval harnesses, computer-use automation, Tavily search API integration
Languages: Python, TypeScript, C#, Java, C++, JavaScript, SQL, Bash
Backend and APIs: FastAPI, .NET Core, Spring Boot, REST APIs, microservices, async job queues, multi-threaded services
Frontend: React, Next.js, Angular, TypeScript, Tailwind CSS
Data and Databases: PostgreSQL, Oracle, MySQL, SQL Server, Scrapy, ETL pipelines, query optimization, indexing
Cloud and Infrastructure: AWS (EC2, S3, Lambda), GCP, Docker, Kubernetes, Vercel, Render
Delivery and Practices: GitHub Actions CI/CD, Prometheus, Grafana, Splunk, pytest, Vitest, requirements gathering, stakeholder communication, Agile/Scrum

PROJECTS

HuntLoop: AI Job Search Automation and Matching Platform (Open Source) | Jun 2026 - Present
github.com/Niramay-Kelkar/HuntLoop

- Built an end-to-end pipeline (Python, Scrapy, FastAPI, PostgreSQL, Docker) scraping **130K+ postings** from **743 companies** across 7 ATS platforms, fuzzy-matched against **1.4M DOL records** to surface employer sponsorship history. Runs unattended nightly on cron.
- Designed a hybrid ranking layer blending Sentence-BERT embeddings (pgvector, **100% coverage**) with skills matching, backed by a multi-provider LLM router with automatic failover, tuned against an **11-job validation harness** rather than by guesswork.
- Shipped production-grade: Next.js and Tailwind frontend, GitHub Actions CI/CD with **580+ tests**, branch protection, CodeQL, secret scanning, and Prometheus/Grafana observability. Built end to end with Claude Code.
- Integrated Tavily's search API into a live company research feature, surfacing summaries, news, funding, and hiring signals for all **389 tracked companies**. Designed a credit-conscious single-call extraction pattern and a calendar-month-aware budget ledger, backfilling the full set at **392 of 1,000 monthly credits** with headroom to spare.
- Shipped an anonymous feedback and triage pipeline (FastAPI, Groq/Gemini router, Prometheus/Grafana): a capture endpoint returning **202** with async LLM triage, per-IP rate limiting, and a public status page surfacing only reviewed items, feeding a live Grafana panel tracking feedback volume by category.

Hands-Off: Computer-Use Automation for Legacy Web Consoles | Aug 2026
github.com/Niramay-Kelkar/hands-off

- Built an LLM-driven discovery agent that explores a live UI and records each run as a typed, replayable capability artifact, giving deterministic replay with human-in-the-loop escalation and safety guardrails on destructive actions.
- Extended it to a live external credit-union console, adding a capability API, a chatbot interface and an operations dashboard on top of the recorded capabilities.

WORK EXPERIENCE

Software Engineer, Atos (client: Thomas Built Buses) | Aug 2022 - Aug 2026
High Point, NC

- Built an autonomous remediation agent (Python, SAP data replication, REST polling) from zero prior spec for an unscoped manufacturing problem, polling every 15 minutes to **cap a previously unbounded production delay**, owned end to end from requirements gathering through deployment.
- Rearchitected **5 production microservices** (.NET Core, C#) from synchronous call paths into async job queues with structured retry logic, **eliminating weekly unplanned outages**.
- Built a Prometheus and Splunk observability stack from scratch, **cutting incident detection time by 40 percent**. Separately diagnosed missing Oracle composite indexes across **3 high-traffic APIs**, **stopping recurring on-call escalations within one sprint**.
- Drove Claude Code adoption as one of **3 licensed engineers onsite**, designing prompt and documentation formats with senior devs and **cutting documentation time from weeks to under one week across 80 applications**, then extending the workflow to root cause analysis and feature development.
- Ran requirements gathering, scoping, and sign-off directly with client business users across **3 internal teams**, owning solution design end to end from analysis through estimates.

Software Engineer Intern, Nok Nok | Jun 2021 - Dec 2021
San Jose, CA

- Cut pre-release test runtime **60%** by identifying sequential JMeter execution as the bottleneck and rebuilding it to run load plans in parallel across isolated Kubernetes pods on GCP at no added cost.
- Caught **3 concurrency bugs and 2 memory leaks** invisible at normal load by building a **10,000-concurrent-request simulation**.

Software Engineer, Advanced (One Advanced) | May 2017 - Dec 2019
Vadodara, Gujarat, India

- Built and owned the backend for a live sports ticketing platform serving Premier League clubs including Liverpool and Everton, handling concurrent seat reservations for **30,000 to 55,000 attendee** events through on-sale spikes without downtime.
- Led the migration of IBM AS400/RPG business logic into .NET MVC services as primary backend engineer, improving deployment frequency **40%** and enabling independent service-level releases for the first time.

EDUCATION

M.S. Information Systems, Northeastern University - Boston, MA (Jan 2020 - May 2022)
B.E. Computer Engineering, Gujarat Technological University - Anand, India (Aug 2013 - May 2017)
