Niramay Kelkar

San Jose, CA | (857) 263-1743 | niramayrkelkar@gmail.com | linkedin.com/in/niramay-kelkar | github.com/Niramay-Kelkar

SUMMARY

Full-stack software engineer with 6 years of experience building production backend services (Java, Python, C#) and user-facing applications (React, Angular, Next.js). Experience spans legacy-to-microservice migrations, RESTful API design, relational database performance tuning, and observability tooling on AWS and Kubernetes. Builds and ships AI-native tooling, from integrating LLMs into daily engineering workflows to a personal AI-powered job-matching platform used in production.

TECHNICAL SKILLS

Languages: Java, Python, C#, C++, JavaScript, TypeScript, SQL, Bash
Backend and APIs: Spring Boot, FastAPI, .NET Core, REST APIs, microservices, async processing, multi-threaded services, object-oriented design
Frontend: React, Next.js, Angular, TypeScript, Tailwind CSS, Vue.js, ASP.NET MVC Razor (supporting)
AI and LLM Tools: Claude Code, LLM-assisted development, Sentence-BERT, pgvector, semantic search, multi-provider LLM routing, RAG-style resume-grounded generation, ML data pipelines
Databases: PostgreSQL, Oracle Database, MySQL, Microsoft SQL Server, query optimization, indexing, connection pooling
Cloud and Infrastructure: AWS (EC2, S3, RDS, Lambda, SQS), GCP, Docker, Kubernetes
Observability: Prometheus, Grafana, Splunk, New Relic, SLI/SLO, structured logging
Tools and Practices: GitHub Actions, Jenkins, JMeter, Selenium, Agile/Scrum, ServiceNow

WORK EXPERIENCE

Software Engineer, Atos (client: Thomas Built Buses) | Aug 2022 - Aug 2026
High Point, NC

- Built reliability for **5 production .NET Core and C# microservices** by identifying recurring failure patterns and introducing async job queuing, structured retry logic, and input validation that decoupled slow downstream dependencies from synchronous request paths, **eliminating weekly unplanned outages**.
- Built a Prometheus and Splunk observability stack from scratch with SLI/SLO baselines and alert thresholds where none had existed, **reducing incident detection time by 40 percent** and cutting post-mortem investigation from several hours to **under 2 hours**.
- Eliminated recurring on-call escalations across three high-traffic APIs by analyzing Oracle DB execution plans and rewriting inefficient queries with missing composite indexes, **stopping the pages entirely within one sprint**; also built an autonomous remediation agent polling every **15 minutes** against SAP records to **cap a previously unbounded production delay**.
- Cut documentation effort from several weeks to **under one week** by integrating Claude Code into daily engineering workflows, using structured prompt templates to produce consistent functional and technical specs across **80 applications**, and applying the same approach to root cause analysis for critical incidents, boilerplate code generation, and new feature development.

Software Engineer Intern, Nok Nok | Jun 2021 - Dec 2021
San Jose, CA

- Reduced pre-release test runtime by **60 percent** by identifying sequential JMeter execution as a bottleneck and rebuilding the infrastructure to run load test plans in parallel across isolated Kubernetes pods on GCP at no added cost.
- Caught **3 concurrency bugs and 2 memory leaks** invisible at normal load by building a **10,000-concurrent-request** simulation, resolving all five before production deployment and preventing customer-facing failures and emergency hotfixes.
- Integrated automated security scanning into **3 CI/CD pipelines** with merge-blocking on scan failures, ensuring no vulnerable build reached staging or production.

Software Engineer, Advanced (One Advanced) | May 2017 - Dec 2019
Vadodara, Gujarat, India

- Built and owned the backend for a live sports ticketing platform serving Premier League clubs including Liverpool, Everton, Sheffield United, and Nottingham Forest, handling concurrent seat reservations for events with **30,000 to 55,000 attendees** through on-sale traffic spikes without downtime.
- Led the migration of IBM AS400/RPG business logic into **.NET MVC services** as the primary backend engineer, **improving deployment frequency by 40 percent** and enabling independent service-level releases for the first time.

PROJECTS

HuntLoop: AI Job Search Automation and Matching Platform (Open Source) | Jun 2026 - Present
github.com/Niramay-Kelkar/HuntLoop

- Built an end-to-end data pipeline (Python, Scrapy, FastAPI, PostgreSQL, Docker) scraping **130K+ postings** from **743 companies** across **7 ATS platforms** and fuzzy-matching employers against **1.4M DOL LCA records** to surface H-1B sponsorship history, running unattended nightly via scheduled cron.
- Designed a hybrid AI ranking layer blending Sentence-BERT embeddings (pgvector) with skills matching to score postings against a resume, backed by a multi-provider LLM router (Groq, Gemini) with automatic failover for skills-gap analysis and resume-grounded application drafting.
- Shipped as production-grade open source with a Next.js, TypeScript, and Tailwind CSS frontend, GitHub Actions CI/CD (**580+ tests**, branch protection, CodeQL, Dependabot, secret scanning), and Prometheus/Grafana observability, built with an AI-assisted workflow using Claude Code.

EDUCATION

M.S. Information Systems, Northeastern University - Boston, MA (Jan 2020 - May 2022)
B.E. Computer Engineering, Gujarat Technological University - Anand, Gujarat, India (Aug 2013 - May 2017)
